

Design & Construction/ Property Management

In today's economic climate, there is an increased focus on professionals with specific skills and experience in the areas of construction, engineering, infrastructure and property management. The McCormick Group is accomplished in identifying, contacting and attracting top candidates for cutting-edge opportunities in these areas. We also help candidates properly evaluate new positions as they move along in their career paths.

Our clients are national and local employers in commercial, residential and infrastructure construction, including development companies and engineering firms engaged in design build work as well as facilities engineering and restoration consulting. In addition, we work with companies whose specialty is the design and construction of roads, bridges and tunnels. Firms engaged in this type of work will face an ever-increasing need for estimators, project managers, civil and structural engineers and other professionals as the nation embarks on a major infrastructure initiative.

The commitment to reduce our dependence on foreign energy is high on our nation's list of priorities. Companies that produce and transport oil, natural gas, nuclear power and renewable energy are dedicated to finding solutions to meet the country's energy needs. The McCormick Group has the resources to identify the engineers, project managers and other professionals these firms need to meet their commitments.

Real estate companies looking to contain costs and achieve greater returns are placing increased demands on property management professionals. Employers are in search of candidates with the rare combination of property management and financial expertise. The McCormick Group conducts searches for a broad range of positions including vice presidents of operations, as well as senior and assistant property managers.
